AQA A-LEVEL CHEMISTRY

Combustion of Alkanes: Complete & Incomplete Combustion

Learn Pack

This pack is designed to be completed alongside the video to help you build a secure understanding of this topic before moving on to revision and exam practice.

WATCH THE LESSON

Alkanes as Fuels

Short chain alkanes are often used as fuels.

This is because they release a _____ amount of energy per gram of fuel.

A fuel is substance that _____ when it is burned.

Lesson Objectives:

- Know that alkanes are used as fuels.
- Know that the combustion of alkanes and other organic compounds can be complete or incomplete.
- Be able to write equations for complete and incomplete combustion reactions.

Explain why short chain alkanes are generally preferred over longer chain alkanes as fuels.

Complete Combustion

When fuels combust, they react with oxygen in the air and release energy, usually in the form of heat. Complete combustion occurs when fuels burn in a plentiful supply of oxygen:

When balancing equations for combustion reactions:

1. Balance the carbons; the number of carbon atoms in total on the left equals the number of carbon dioxide molecules formed.
2. Balance the hydrogens; divide the total number of hydrogen on the left by two and this equals the number of water molecules formed.
3. Balance the oxygens; work out the total number of oxygen atoms in your products, subtract the number of oxygen atoms, if any, in your fuel and then half this value, this equals the number of oxygen molecules required.

Balance the following equations:

Incomplete Combustion

Incomplete combustion occurs when fuels are burned in an insufficient supply of oxygen. During incomplete combustion the hydrogen atoms are always oxidised to form water, but the carbon atoms are only partially oxidised forming either:

-
-
-

Balancing equations for incomplete combustion reactions follows the same process as complete combustion. Balance these equations:

What are the two problems associated with incomplete combustion:

1. _____
2. _____

Carbon Monoxide

Carbon monoxide is a colourless, odourless, poisonous gas.

Explain the effect of carbon monoxide on the body.

Practise Questions – Fact Recall

1. What is a fuel?

2. Why are short chain alkanes often used as fuels?

3. What are the products of complete combustion?

4. State the conditions necessary for incomplete combustion.

5. What are the problems associated with incomplete combustion?

Practise Questions – Application

1. Write the equation for the complete combustion of hexane (C_6H_{14}).

2. Write the equation for the incomplete combustion of hexane (C_6H_{14}) that produces gaseous products only.

What next?

The next step in the Learn, Revise, Practise Method is Revise, where you'll strengthen your memory through retrieval practice exercises before moving on to Practise and applying your knowledge to exam questions.
